

Illuminated mirror

Your illuminated mirror offers the option of switching between the dimmable version and the non-dimmable version. To do this, screw on the switch box (photo above) on the back. There is a switch in the module (see left). In position 1, the dimmer is switched on. In position 2, the touch switch only works in ON/OFF mode.

To dim, switch on your mirror. If you now press the switch a little longer, the illuminated mirror can be dimmed.

If your mirror has the optional heating, switch it on when you switch on the light.
